Big Poppa Mining Command Center

A mining rig with an engineering discipline

A custom mining environment that separates GPU monitoring from workload ownership and safety decisions. Its approved neon interface makes that engineering understandable without pretending a simulated control is a production command.

Observe clearly

Readings carry native units, source times and explicit stale/unavailable states.

Validate the whole run

A dated 15-minute trial recorded 212.5 TH/s mean, confirmed shutdown and independent power-limit restoration.

Keep authority deliberate

The existing supervisor owns safety. Persistent V2 and authenticated remote controls remain pending.

AI-assisted development directed and refined by Daniel Kavanagh. Technical evidence was reviewed against source and dated project records.

STATUS Visual UI and later read-only telemetry verified at recorded checkpoints; no fresh production certification.
