Formula None Fitness

Personal fitness software at the hardware boundary

A native iOS fitness project connecting workout, activity, goals and nutrition records with source -aware calculations. Premium Fusion is the approved visual direction, and Today M1 now runs in Simulator with fictional data. GE scale and Zepp watch experiments extend the work into hardware integration.

Track the work

SwiftUI/SwiftData source covers exercise logs, activity, goals and nutrition; device acceptance is separate.

Investigate the scale

GE CS10G BLE framing, authentication and decoded capture review exist in source; hardware acceptance remains experimental.

Question the watch

Zepp calorie snapshots, phone receipts and a BLE probe exist; native watchOS and uninterrupted reporting are unverified.

AI-assisted development directed and refined by Daniel Kavanagh. Technical evidence was reviewed against source and dated project records.

STATUS Today M1 is implemented in Simulator; other Fusion views are artwork. Hardware acceptance remains pending.
